Claims

We claim:

A method for forming an electronic structure, comprising the steps of:

providing a substrate; and

3

soldering a lead-free solder member to the substrate without using a joining solder to

effectuate the soldering, wherein the solder member comprises a tin-antimony alloy that includes

about 3% to about 15% antimony by weight.

- 2. The method of claim 1, wherein the tin-antimony alloy includes about 5% to about 10% antimony by weight.
- 3. The method of claim 1, wherein the soldering step includes reflowing the solder member.
- 4. The method of claim 1, wherein the soldering step reduces a height of the solder member 1
- 2 between about 25% and about 30%.
- 1 5. The method of claim 1, wherein the substrate includes a ceramic ball grid array (CBGA)
- 2 module or a plastic ball grid array (PBGA) module.

7. A method for forming an electronic structure, comprising the steps of:

providing a first substrate and a second substrate;

soldering a lead-free solder member to the first substrate without using a joining solder to effectuate the soldering, wherein the solder member comprises a tin-antimony alloy that includes about 3% to about 15% antimony by weight; and

soldering the solder member to the second substrate with a lead-free joiner solder.

- 8. The method of claim 7, wherein the tin-antimony alloy includes about 5% to about 10% antimony by weight.
- 9. The method of claim 7, wherein the step of soldering the solder member to the second substrate includes reflowing the joiner solder at a temperature above a liquidus temperature of the joiner solder and below a highest temperature which will not damage any portion of the electronic structure.
- 1 10. The method of claim 7, wherein the step of soldering the solder member to the second
- 2 substrate includes reflowing the joiner solder at a temperature above a liquidus temperature of
- 3 the joiner solder and below about 250 °C.

- 1 11. The method of claim 7, wherein the step of soldering the solder member to the second
- 2 substrate includes reflowing the joiner solder at a temperature above a liquidus temperature of
- 3 the joiner solder and below a highest temperature which will not damage any portion of the
- 4 electronic structure.

- 12. The method of claim 7, wherein the joiner solder comprises a tin-silver-copper alloy that includes by weight about 95.5-96.0% tin, about 3.5-4.0% silver, and about 0.5-1.0% copper.
- 13. The method of claim 12, wherein the step of soldering the solder member to the second substrate includes reflowing the joiner solder at a temperature between about 230 $^{\circ}$ C and about 250 $^{\circ}$ C.
- 14. The method of claim 7, wherein the step of soldering the solder member to the second substrate includes melting the solder member.
- 1 15. The method of claim 14, wherein the step of soldering the solder member to the second substrate includes intermixing the tin-antimony alloy with the joiner solder.
- 1 16. The method of claim 7, wherein the step of soldering the solder member to the second substrate does not include melting the solder member.

- 1 17. The method of claim 16, wherein the step of soldering the solder member to the second
- 2 substrate does not include intermixing the tin-antimony alloy with the joiner solder.
- 1 18. The method of claim 7, wherein the first substrate includes a ceramic ball grid array (CBGA)
- 2 module or a plastic ball grid array (PBGA) module.
- 1 19. The method of claim 7, wherein the first substrate includes a semiconductor chip.
 - 20. An electronic structure, comprising:

a substrate;

a lead-free solder member soldered to the substrate with no joining solder between the solder member and the substrate, wherein the solder member comprises a tin-antimony alloy that includes about 3% to about 15% antimony by weight.

- 21. The electronic structure of claim 20, wherein the tin-antimony alloy includes about 5% to about 10% antimony by weight.
- 1 22. The electronic structure of claim 20, wherein the substrate includes a ceramic ball grid array
- 2 (CBGA) module or a plastic ball grid array (PBGA) module.
- 1 23. The electronic structure of claim 20, wherein the substrate includes a semiconductor chip.

END920010002US1

24. An electronic structure, comprising:

- a first substrate;
- a second substrate; and
- a lead-free solder member soldered to the first substrate with no joining solder between the solder member and the first substrate, wherein the solder member comprises a tin-antimony alloy that includes about 3% to about 15% antimony by weight, and wherein the solder member
- 7 is soldered to the second substrate with a lead-free joiner solder.

5 **5 61**

2

25. The electronic structure of claim 20, wherein the tin-antimony alloy includes about 5% to about 10% antimony by weight.

- 26. The electronic structure of claim 20, wherein the tin-antimony alloy is intermixed with the joiner solder.
- 27. The electronic structure of claim 20, wherein the tin-antimony alloy is not intermixed with the joiner solder.
- 1 28. The electronic structure of claim 20, wherein the joiner solder comprises a tin-silver-copper
- 2 alloy that includes by weight about 95.5-96.0% tin, about 3.5-4.0% silver, and about 0.5-1.0%
- 3 copper.

- 29. The electronic structure of claim 24, wherein the first substrate includes a ceramic ball grid array (CBGA) module or a plastic ball grid array (PBGA) module..
- 30. The electronic structure of claim 24, wherein the first substrate includes a semiconductor
- 2 chip.
